## ⚠ Precautions

Be sure to read before handling. Refer to pages 13-15-3 to 13-15-4 for Safety Instructions and Common Precautions on the products mentioned in this catalog, and refer to page 13-1-5 for Precautions on every series.

### Coution on Design

#### ⚠ Warning

- In cases where workpieces are heavy or dangerous, etc., take measures to address a possible loss of adsorption force (installation of drop prevention guides, etc.).

In the case of transportation by vacuum adsorption using vacuum pads, adsorption force is lost when there is a drop in vacuum pressure. Furthermore, since vacuum pressure can also deteriorate due to wear and cracking of pads, and vacuum leakage from piping, etc., be certain to perform maintenance on vacuum equipment.

### Selection

#### ⚠ Caution

- The pad materials differ depending upon the operating environment.

An appropriate pad material should be selected. Furthermore, since vacuum pads are manufactured for use with industrial products, they should not have direct contact with pharmaceuticals or food products, etc.

- Depending upon the weight and shape of the workpieces, the diameter, quantity and shape of pads will vary.

Use the pad lifting force table for reference. Also, the pads selected will differ based upon conditions other than the above, such as the condition of the workpiece surface (presence or absence of oil or water), the workpiece material and its gas permeability. Confirmation is necessary by actually performing vacuum adsorption testing on the subject workpieces.

- Use a buffer for adsorption on fragile workpieces.

The cushioning by the buffer is necessary when there is variation in the height of workpieces. When further positioning of pads and workpieces is desired, a detent buffer can be used.

- The life of a buffer will be reduced if the lateral force is applied to the buffer shaft. Note that sometimes a load is applied to the buffer by a piping tube (pulling or pressing, etc. in a lateral direction).

- Do not apply an impact or large forces to a pad when adsorbing a workpiece.

This will cause deformation, cracking and wear of the pad to be accelerated. The stiffening ribs, etc. should touch lightly, while staying within the pad skirt's deformation range. Positioning should be performed accurately. Especially in the case of small diameter pads.

- When transporting in an upward direction, factors such as acceleration, wind pressure and impact force must be considered in addition to a workpiece weight.

Use caution particularly when lifting items such as glass plates and circuit boards, because a large force will be applied by the wind pressure. When a workpiece which is oriented vertically is transported horizontally, large forces are applied by acceleration when movement is started and stopped. Further, in cases where the pad and a workpiece can slip easily, accelerations and decelerations of horizontal movement should be kept low.

- When transporting flat workpieces that have large surface areas using multiple pads, care must be taken when arranging the pads to balance the workpiece.

### Maintenance

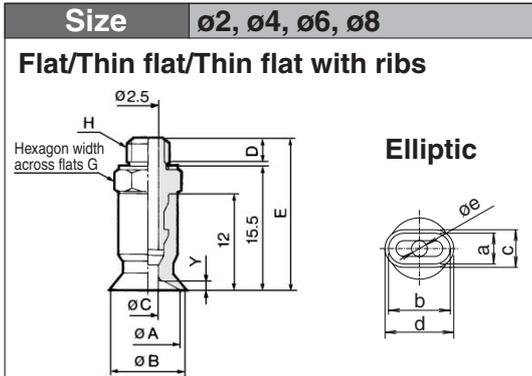

#### ⚠ Caution

- Perform pad maintenance regularly.

Since pads are essentially rubber, deterioration is unavoidable. The rate of deterioration depends upon factors such as conditions of use, environment and temperature. Regular maintenance should be performed. If any damage, splitting, cracking or abrasion has occurred in a pad which appears to be harmful, replace it immediately. Also, take care not to damage the outside of the pad.

# Vacuum Pad: Vertical Vacuum Entry With Buffer

## Series ZPT

### Specifications

Vacuum entry direction		Vertical				
Vacuum entry	Applicable tube dia.	Connection		Female thread	Barb fitting	One-touch fitting
		ø2 to ø8 2 x 4, 3.5 x 7, 4 x 10 Thin section series (ø10 to ø16)		M3 x 0.5 M5 x 0.8	ø4 Nylon tube ø4 Urethane tube	ø4 tube ø6 tube
		ø10 to ø32		M5 x 0.8	ø6 Nylon tube ø6 Urethane tube	ø4 tube ø6 tube
ø40, ø50		M5 x 0.8 Rc 1/8	ø6 Nylon tube ø6 Urethane tube	ø6 tube ø8 tube		
Connection	Thread dia.	ø2 to ø8				
		ø10 to ø32				
		ø40, ø50				
		M8 x 1 Male thread				
		M10 x 1 Male thread				
		M14 x 1 Male thread				
Buffer type		Rotating (J)/Non-rotating (K)				
Buffer stroke		For ø2 to ø8 — 6, 10, 15, 25 mm				
		For ø10 to ø32 — 10, 20, 30, 40, 50 mm				
		For ø40, ø50 — 10, 20, 30, 50 mm				

### Spring Reactive Force (N)

Pad dia. (mm)	0 stroke	Stroke end
ø2 to ø8 *	0.8 N	1.2 N
ø10 to ø32	1.0 N	3.0 N
ø40, ø50	2.0 N	5.0 N

\* Refer to ø2 to ø8 for Thin flat, Thin flat with ribs and Elipse type.

### Pad Type

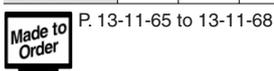

Pad form	Flat	Flat with ribs	Deep	Bellows
Pad diameter (mm)	2, 4, 6, 8, 10, 13, 16, 20, 25, 32, 40, 50	10, 13, 16, 20, 25, 32, 40, 50	10, 16, 25, 40	6, 8, 10, 13, 16, 20, 25, 32, 40, 50
Material (Color)	NBR (Black), Silicon rubber (White), Urethane rubber (Brown), Fluoro rubber (Black with green mark) Conductive NBR (Black with one white mark), Conductive silicon rubber (Black with two white marks)			
Durometer	NBR (50°), Silicon rubber (40°), Urethane rubber/Fluoro rubber (60°) Conductive NBR (50°), Conductive silicon rubber (50°)

# Vacuum Pad: Lateral Vacuum Entry with One-touch Fitting With Buffer

## Series ZPR

### Specifications

Vacuum entry	Direction		Lateral
	Connection		Air suction filter
Applicable tube dia.	2 x 4, 3.5 x 7, 4 x 10 Thin section series (ø10 to ø16) ø2 to ø8		ø4, ø6 tube
	ø10 to ø16		ø4, ø6 tube
	ø20 to ø32		ø4, ø6, ø8 tube
	ø40, ø50		ø6, ø8 tube
Mounting	2 x 4, 3.5 x 7, 4 x 10 Thin section series (ø10 to ø16) ø2 to ø8		M8 x 1 Male thread
	ø10 to ø16		M10 x 1 Male thread
	ø20 to ø32		M10 x 1 Male thread
	ø40, ø50		M14 x 1 Male thread
Buffer type			Rotating (J)/Non-rotating (K)
Buffer stroke			For ø2 to ø8 — 6, 10, 15, 25 mm
			For ø10 to ø32 — 10, 20, 30, 40, 50 mm
			For ø40, ø50 — 10, 20, 30, 50 mm

### Pad Type

# Series ZPT/ZPX Model Selection

A vacuum pad diameter ( $\phi D$ ) can be determined by calculation if the lifting force needed to perform the work function is known. The weight of the workpiece and any potential dynamic forces involved during movement (lifting, stopping, rotating, etc.) need to be considered. The area of one pad can be divided to an equivalent area of multiple pads ( $n$ ) as necessary, based on these forces and the shape of the load.

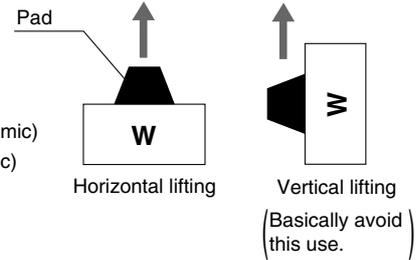

## Calculation Method: Pad Diameter

A vacuum pad diameter with applied safety factor based on lifting orientation of workpiece (vertical or horizontal) can be derived from calculations or by using the Selection Graph shown below.

### Calculation

$$\phi D = \sqrt{\frac{4}{3.14} \times \frac{1}{P} \times \frac{W}{n} \times t \times 1000}$$

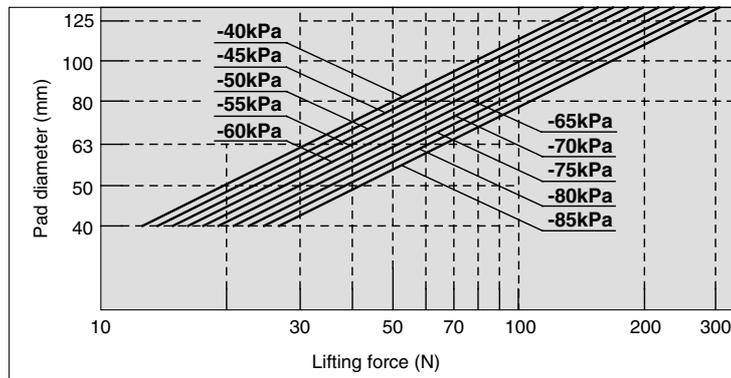

- $\phi D$  : Pad diameter (mm)
- $n$  : Number of pads used
- $W$  : Lifting force (N)
- $P$  : Stable vacuum pressure (kPa)
- $t$  : Safety factor: Horizontal pad contact: 4 (dynamic)  
Vertical pad contact: 8 (dynamic)

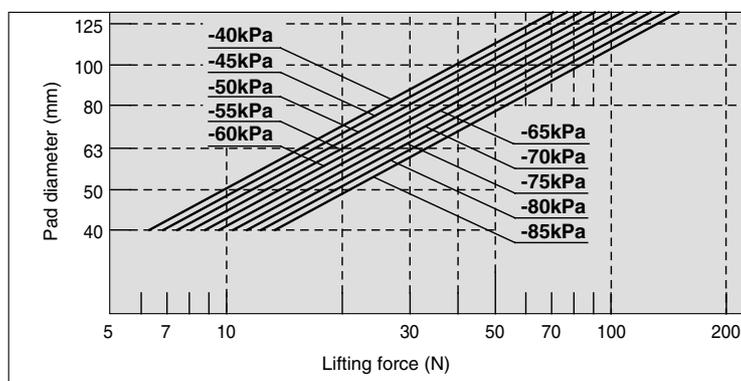

### Selection Graph

The pad diameter required for horizontal (selection graphs (1) and (2)) or vertical contact can be found by setting the weight of the work the number of pads to contact the workpiece and the stable adsorption vacuum pressure.

**Selection Graph (1) Selection Graph of Pad Diameter by Lift Force Horizontal (Reference value)**

**Selection Graph (2) Selection Graph of Pad Diameter by Lift Force Vertical (Reference value)**

#### How to read

Example: Work load 20 kg (Lifting force: 196 N)  
Conditions: Desired number of pads 5 pcs.  
Working vacuum pressure -60 kPa  
Horizontal lifting

#### <Selection procedure>

From left condition Lifting force per pad:  $196 \text{ N} \div 5 \text{ pcs.} = 39.2 \text{ N}$   
From Selection Graph (1) as horizontal lifting Lifting force 39.2 N  
Extend to the y-axis from the corresponding point of vacuum pressure -60 kPa; result is to select a pad diameter bigger than 63 mm.

# Series ZPT/ZPX

## Application Data

### Theoretical Lifting Force

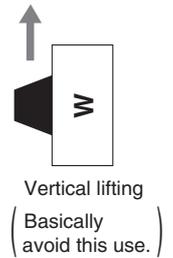

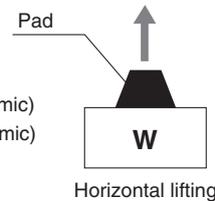

Theoretical lifting force for pad can be derived from calculations or taken directly from theoretical lifting force table.

### Calculation

$$W = P \times S \times 0.1 \times \frac{1}{t}$$

**W** : Lifting force (N)  
**P** : Stable vacuum pressure (kPa)  
**S** : Pad area (cm<sup>2</sup>)  
**t** : Factor of safety:

Horizontal pad contact : 4 (dynamic)  
 Vertical pad contact : 8 (dynamic)

### Theoretical Lifting Force

The theoretical lifting force (not including the safety factor) is found from the pad diameter and vacuum pressure. The required lifting force is then found by dividing the theoretical lifting force by the safety factor.

$$\text{Lifting force} = \text{Theoretical lifting force} \div t$$

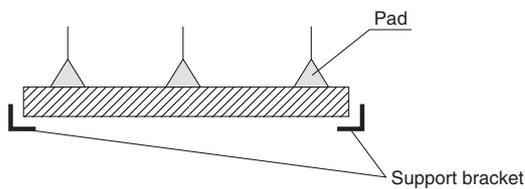

### Theoretical Lifting Force (Theoretical lifting force = P x S x 0.1)

-40	50.4	78.4	124.6	201	314	490.7	

### ⚠ Precautions

1. The quantity and placement of pads should be considered when transferred work has a large surface area.

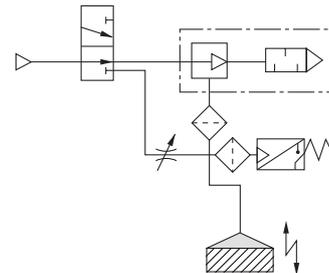

Install support brackets to prevent a workpiece from dropping according to your requirements.

2. Vacuum response time and vacuum breaking time are influenced by internal volume of large bellows size pad, which has more volume than the large flat ribbed type pad.

When response time is important, consider the following measures:

- Use a larger capacity ejector.
- Set a vacuum breaking valve.

## How to Assemble/Disassemble

Remove bolts with a hex. key wrench from the pad underside. Tighten new pad with the bolts ensuring there is no gap between the adaptor plate and the pad.

## How to Distinguish Different Pad Materials

Checking the mark on the pad's interior surface as shown in the figure on the left.

Material	Color	Mark

The above table covers only general characteristics of subject rubber materials.

Pad materials used by SMC pass the nominal JIS material standards; however, actual performance depends on operating conditions.

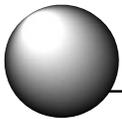

## Interchangeable with flat pad with ribs for heavy loads.

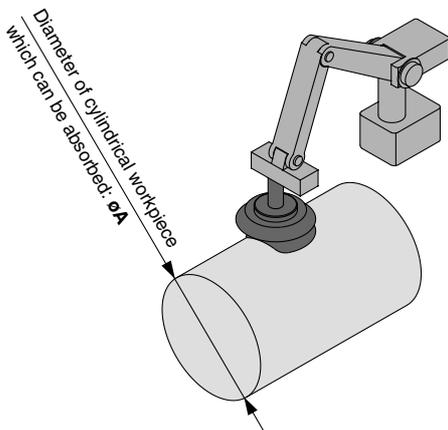

When changing to a different shape pad due to load change, the pad can be easily interchanged.

Possible combination——Same pad diameter,  $\phi 40$  and  $\phi 50$ ,  $\phi 63$  and  $\phi 80$ ,  $\phi 100$  and  $\phi 125$

## Possible adsorption to cylindrical loads with easy fit to the load shape.

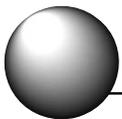

\* Pushing force for adsorption is almost equivalent to return force of buffer spring.

Table (1) Diameter of Cylindrical Workpiece Which can be Absorbed. (Reference value)

Model	Dia. of cylindrical workpiece which can be absorbed: $\phi A$ <sup>(1)</sup>
ZP 40HB□	$\phi 80$ or more
50HB□	$\phi 100$ or more
63HB□	$\phi 120$ or more
80HB□	$\phi 160$ or more
100HB□	$\phi 180$ or more
125HB□	$\phi 230$ or more

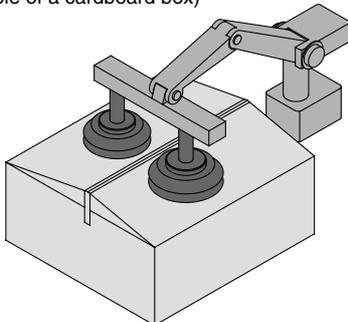

Note 1) Please consult with SMC when requiring a diameter smaller than shown in table.

Note 2) Regard values mentioned above as reference only, since actual valves may depend on operating conditions.

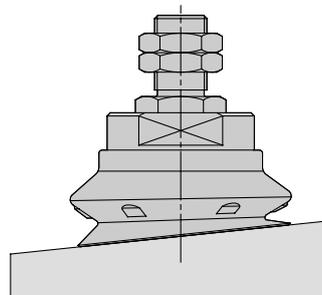

## Pad shape permits adsorption to sloped surfaces.

- When a workpiece could be deformed during adsorption or transportation. (Example of a cardboard box)

- When the adsorption surface of a workpiece is slanted. (Maximum angle:  $5^{\circ}$ \*)

\* Regard values mentioned above as reference only, since actual valves may depend on operating conditions.

# Vacuum Pad: Ball Joint Type

# Series ZPT/ZPR

Pad diameter:  $\phi 10, \phi 13, \phi 16, \phi 20, \phi 25, \phi 32, \phi 40, \phi 50$

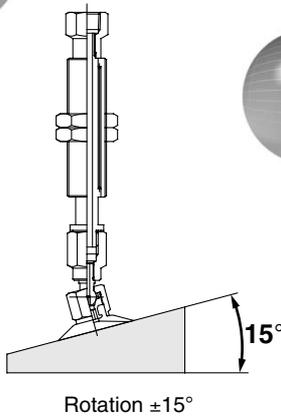

Pad material: NBR, Silicon rubber, Urethane rubber,

Fluoro rubber, Conductive NBR, Conductive silicon rubber

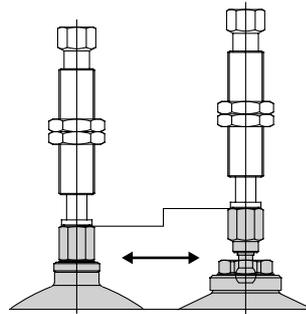

## Series Variations

Adsorption is possible even on a slanted surface.

Interchangeable with standard type.

Exchangeable at the adapter

Conductive silicon rubber	50°	-10 to 200	X	X	○	X	◎	◎	X	○	X

The above table covers only general characteristics of subject rubber materials.

Pad material used by SMC pass the nominal JIS material standards; however, actual performance depends on operating conditions.

## ⚠️ Precautions

Be sure to read before handling. Refer to pages 13-15-3 to 13-15-4 for Safety Instructions and Common Precautions on the products mentioned in this catalog, and refer to page 13-1-5 for Precautions on every series.

### Caution on Design

#### ⚠️ Warning

- In case where the workpieces are heavy or dangerous objects, etc., take measures to address a possible loss of adsorption force (installation of drop prevention guide, etc.).

In the case of transportation by vacuum adsorption using vacuum pads, adsorption force is lost when there is a drop in vacuum pressure.

Furthermore, since vacuum pressure can also deteriorate due to wear and cracking of pads, and vacuum leakage from piping, etc., be certain to perform maintenance on vacuum equipment.

### Selection

#### ⚠️ Caution

- The pad materials which can be used differ depending upon the operating environment.

An appropriate pad material should be selected.

Furthermore, since vacuum pads are manufactured for use with industrial products, they should not come into direct contact with medicines or food products, etc.

- Depending upon the weight and shape of the workpieces, the diameter, quantity and shape of pads suitable for use will vary.

Use the pad lifting force table for reference.

Also, the pads to be selected will differ based upon conditions other than the above, such as the condition of the workpiece surface (presence or absence of oil or water), the workpiece material and its gas permeability. Confirmation is necessary by actually performing vacuum adsorption on the subject workpieces.

- Use a buffer for adsorption on fragile workpieces.

The cushioning performed by the buffer is also necessary when there is variation in the height of workpieces. When it is desired to perform further positioning of pads and workpieces, a detent buffer can be used.

- The life of the buffer will be reduced if lateral force is applied to the buffer shaft.

Note that sometimes a load is applied to the buffer by a piping tube (pulling or pressing, etc. in a lateral direction).

- Do not apply an impact or large force to a pad when adsorbing a workpiece.

This will cause deformation, cracking and wear of the pad to be accelerated. The stiffening ribs, etc. should touch lightly, while staying within the pad skirt's deformation range. Positioning should be performed accurately. Especially in the case of small diameter pads.

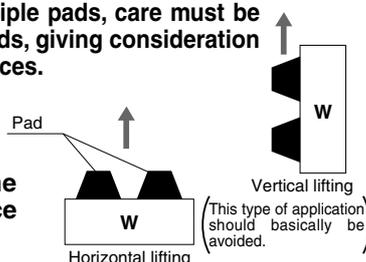

- When transporting in an upward direction, factors such as acceleration, wind pressure and impact force must be considered in addition to the workpiece weight.

Use caution particularly when lifting items such as glass plates and circuit boards, because a large force will be applied by wind pressure. When a workpiece which is oriented vertically is transported horizontally, large forces are applied by acceleration when movement is started and stopped. Further, in cases where the pad and workpiece can slip easily, accelerations and decelerations of horizontal movement should be kept low.

- When transporting flat shaped workpieces that have large surface areas using multiple pads, care must be taken in arranging the pads, giving consideration to balance of the workpieces.

- Use caution since the workpiece could rotate during transfer.

Use of more than one pad for each workpiece is recommended.

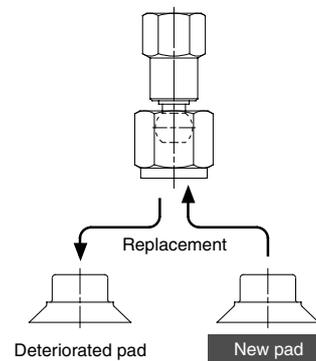

### Maintenance

#### ⚠️ Caution

- Perform pad maintenance regularly.

Since pads are essentially rubber, deterioration is unavoidable. The rate of deterioration depends upon factors such as conditions of use, environment and temperature. Regular maintenance should be performed. If any damage, splitting, cracking or abrasion has occurred in a pad which appears to be harmful, replace it immediately.

Also, take care not to damage the outside of the pad.

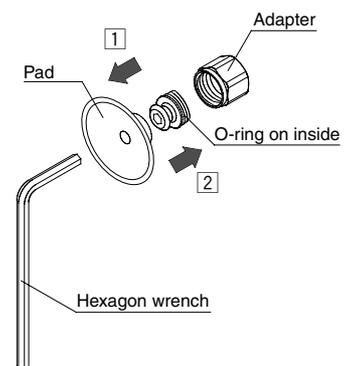

### How to Assemble/Disassemble

#### ⚠️ Caution

Pad diameter:  $\varnothing 10$  to  $\varnothing 32$

- Insert a hexagon wrench from the bottom of the pad, loosen the screw and remove the old pad from the adapter.

- Place a new pad on the adapter, and after confirming that the O-ring is in place, retighten the screw with the hexagon wrench.

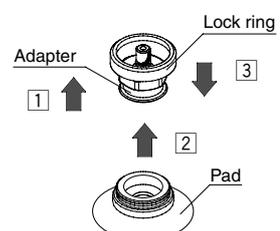

Pad diameter:  $\varnothing 40$ ,  $\varnothing 50$

- Pull the lock ring upward, and after lifting it to the adapter, remove the old pad by pulling it downward.

- When holding the lock ring in the raised position, place a new pad onto the adapter.

- Confirm that the pad is securely in place, and then return the lock ring to its original position.
